

PHP - hae varauksia

Alla olevassa esimerkissä haetaan varauksia aikavälillä 22.11.2013 - 25.11.2013 luokkatilasta U423.

```
<?php
$url = 'https://opendata.metropolia.fi/rl/reservation/search';
$apiKey='myApiKeyHere:'; // required ':' after the api-key
$query= "{
    \"startDate\": \"2013-11-22T09:00\",
    \"endDate\": \"2013-11-25T15:00\",
    \"room\": [\"U423\"]
}";
$session = curl_init($url); // set up session
curl_setopt($session,
CURLOPT_USERPWD, $apiKey); // authentication
curl_setopt($session, CURLOPT_POSTFIELDS, $query); // add query entries
$response = curl_exec($session); // execute and get response
curl_close($session); //close session
var_dump($response);
?>
```

You can also add following parameters if necessary (after curl_setopt -line):

```
curl_setopt($session, CURLOPT_SSL_VERIFYPEER, false); // skips verification if certificates cause problems
```

```
curl_setopt($session, CURLOPT_RETURNTRANSFER, true); // returns data as string
```
